

whereby science can be used to stimulate the reading program, the language arts, the fine and practical arts, the health program, mathematics and the social studies. The author shows that a well-organized science unit can be developed which will include and maintain a balanced emphasis and desirable relationships with all the areas of learning. True scientific learning is a democratic procedure where many pupils cooperate in solving common problems and such problems usually involve more than science.

In the chapters dealing with methods

of teaching the various phases of science, the author has contributed his most fruitful work. General description has been held to a minimum. The why and the how have received major emphasis. Each chapter contains many questions asked and those likely to be asked by children. Methods of procedure in answering these questions are suggested and discussed. It is in these chapters that the teacher will find a wealth of teaching aids and suggestions whereby she can use her own ingenuity.

The text has an abundance of excellent photographs of children at work

performing scientific experiments. Numerous drawings will help the teacher in preparing apparatus for experiments. Since most of the material needed for building the apparatus is not costly and much of it can be secured in the home, the teacher will welcome these aids.

At the end of each chapter in the text is a useful study guide. There are included, also, topical references which the teacher can use to advantage.
